

ABSTRACT

A client terminal such as a mobile phone used in a client server system includes a locator for locating an exclusive server and a browser for downloading special information stored in the exclusive server. The exclusive server is provided and administered by a terminal maker to supply information exclusively to its clients who use the terminal it makes. The locator and the browser are installed in the client terminal before the terminal is sold. The client server system may be designed to automatically change an initial display on the client terminal to give the client an additional amusement upon access to the exclusive server.
